By convention, polyacrylamide gels are characterized by a pair of values, %T and %C (13). In this convention, %T is the weight percentage of total monomer (acrylamide + bis) in g/100 ml and %C is the proportion of bis as a percentage of total monomer.

Make it a double: A method for the selective  $\alpha$ -dehydrogenation of amides in the presence of other carbonyl moieties under mild conditions has been developed. This strategy relies on electrophilic activation coupled to in situ selective selenium-mediated dehydrogenation. Mechanistic experiments suggest formation of an electrophilic Se IV species.
