Applied Linear Regression Models by John Neter, William

1.2 Simple linear regression model $\hat{Y}_i = \beta_0 + \beta_1 X_i + \epsilon_i$ (1.1) In this model β_0 , β_1 , and ϵ_i are parameters and Y_i and X_i are measured values. This is called a "first order model" because it is linear in both the parameters and the independent variable.

Applied Linear Regression, Third Edition has been thoroughly updated to help students master the theory and applications of linear regression modeling. Focusing on model building, assessing fit and reliability, and drawing conclusions, the text demonstrates how to develop estimation, confidence, and testing procedures primarily through the use of least squares regression.

2.1.4: The ANOVA table for this linear model looks like Analysis of Variance Table Response: Wt Df Sum Sq Mean Sq F value Pr(>F) Ht 1 159.95 159.95 2.237 0.1731 Residuals 8 572.01 71.50 From which we see that the F statistic is given by $F = 2.237$ and equals $t^2_{1} = (1.496)^2$ as it must. See the R script chap2prob1.R for the various parts of this problem.

Results are also given for the class of generalized linear models (e.g., logistic regression, log-linear models, etc.). We recommend fundamental change in strategies for model comparisons in social research as well as modifications in the presentation of results from regression or regression-type models.
