Intraoperative neurophysiological monitoring (IONM) or intraoperative neuromonitoring is the use of electrophysiological methods such as electroencephalography (EEG), electromyography (EMG), and evoked potentials to monitor the functional integrity of certain neural structures (e.g., nerves, spinal cord and parts of the brain) during surgery. The purpose of IONM is to reduce the risk to the ...

General anaesthetics (or anesthetics, see spelling differences) are often defined as compounds that induce a reversible loss of consciousness in humans or loss of righting reflex in animals. Clinical definitions are also extended to include the lack of awareness to painful stimuli, sufficient to facilitate surgical applications in clinical and veterinary practice.

Summary. Sexual harassment of women in medicine has become a subject of national debate after a senior female surgeon stated that if a woman complained of unwanted advances her career would be jeopardised, and subsequent reports suggest that sexual harassment is a serious problem in the medical profession.

Urolithiasis, or urinary tract stones, is the aggregation of crystals in the urine, most commonly composed of calcium oxalate. 1 Urinary tract stones are responsible for renal colic, which is the most common symptomatic presentation of urolithiasis. The formation of calculi in the upper urinary tract is a problem that places a considerable burden on primary care physicians.

Tracheostomy is a common procedure performed in critically ill patients requiring prolonged mechanical ventilation for acute respiratory failure and for airway issues. The ideal timing (early vs late) and techniques (percutaneous dilatational, other new percutaneous techniques, open surgical) for tracheostomy have been topics of considerable debate.
