knowledge of cell biology has also led to practical discoveries about the mechanisms of cancer. Specific molecules that control the progression of a cell through the cell cycle regulate cell growth. An understanding of normal cell cycle processes and how those processes go awry provides key information about the mechanisms that trigger cancer.

Cancer and the Cell Cycle Heide L. Ford\* and Arthur B. Pardee Dana-Farber Cancer Institute, Boston, Massachusetts 02115 Abstract The purpose of this short review is to provide an overview of mammalian somatic cell cycle events and their controls. Cell cycle-related studies have been under way for only 5% of this millennium, yet since then nearly

Cancer is unchecked cell growth. Mutations in genes can cause cancer by accelerating cell division rates or inhibiting normal controls on the system, such as cell cycle arrest or programmed cell death. As a mass of cancerous cells grows, it can develop into a tumor.

Targeting the Cell Cycle: A New Approach to Cancer Therapy ... PDF Figures and Tables ... Cancer represents a dysregulation of the cell cycle such that cells that overexpress cyclins or do not express the CDKs continue to undergo unregulated cell growth. The cell cycle also serves to protect the cell from DNA damage.

2. THE CELL CYCLE AND ITS REGULATION. The cell cycle governs the transition from quiescence (G<sub>0</sub>) to proliferation while ensuring the fidelity of the genetic transcript. The phases associated with dna synthesis (S phase) and mitosis (M phase) are separated by the gaps G<sub>1</sub> and G<sub>2</sub>.
