Protecting the Dynamic Datacenter - Trend Micro

Uncontrolled format string is a type of software vulnerability discovered around 1989 that can be used in security exploits. Previously thought harmless, format string exploits can be used to crash a program or to execute harmful code. The problem stems from the use of unchecked user input as the format string parameter in certain C functions that perform formatting, such as printf().

Phishing is the fraudulent attempt to obtain sensitive information such as usernames, passwords and credit card details by disguising as a trustworthy entity in an electronic communication. Typically carried out by email spoofing or instant messaging, it often directs users to enter personal information at a fake website, the look and feel of which are identical to the legitimate site.

Phishing - Wikipedia

The software constructs all or part of an OS command using externally-influenced input from an upstream component, but it does not neutralize or incorrectly neutralizes special elements that could modify the intended OS command when it is sent to a downstream component.

CWE-78: Improper Neutralization of Special Elements used

Web Vulnerability Scanners. Burp Suite - Burp Suite is an integrated platform for performing security testing of web applications. Its various tools work seamlessly together to support the entire testing process, from initial mapping and analysis of an application's attack surface, through to finding and exploiting security vulnerabilities.

PentestBox Tools

Adopting third-party libraries to encode user input in the development phase and using a web application firewall in the deployment phase could fool web security managers into thinking their web applications are completely safe from Cross-Site Scripting (XSS) attacks.
