between the measured RF output power of the devices and the power that would be predicted from DC I-V characterization, according to the equation $P_{out} = \frac{I_{RF}^2 R_{out}}{8}$, where I_{RF} and V_{RF} are the RF current swing and voltage swing. In this paper pulsed DC I-V and RF time domain waveform measurements are presented to analyze the

Abstract: RF I-V waveform measurement and engineering systems are now finally enabling practical waveform engineering to be directly undertaken with systems capable of supporting continuous wave stimulus reaching a high level of maturity. On-going research and development activities are presently addressing the multitone requirement. The availability of RF I-V measurement and engineering ...
