### **Engineer's Mini-Notebook - Formulas, tables and Basic Circuits**

In electronics, emitter-coupled logic (ECL) is a high-speed integrated circuit bipolar transistor logic family. ECL uses an overdriven BJT differential amplifier with single-ended input and limited emitter current to avoid the saturated (fully on) region of operation and its slow turn-off behavior. As the current is steered between two legs of an emitter-coupled pair, ECL is sometimes called ...

The 555 timer IC is an integrated circuit (chip) used in a variety of timer, pulse generation, and oscillator applications. The 555 can be used to provide time delays, as an oscillator, and as a flip-flop element. Derivatives provide two or four timing circuits in one package. Introduced in 1972 by Signetics, the 555 is still in widespread use due to its low price, ease of use, and stability.

There are lots of different types of MOSFETs out there, so picking a specific one to use can be a little bit overwhelming. For the projects here I will be using ZVP2110A and ZVN2110A for pretty much everything. They are a bit outdated, but more than adequate for our purposes here.

A particular symptom could be caused by one of several problems, or even by more than one problem at the same time! All of the gizmos we have fix a specific problem. If a symptom could be caused by two things, Murphy's Law says that if you just pick one without taking measurements, the problem will be caused by the other thing, that a different gizmo fixes.

After yesterday's post about what determines temperature, I thought I would revisit one of the most convincing evidences of Earth's greenhouse effect.. As I've mentioned before, a handheld infrared thermometer is a great little tool to help gain physical insight into the thermal radiative (infrared) effect the atmosphere has on surface temperature.
